TEYAhropoietin structure-function relationships: high degree of
Sequence homology among mammals.",
Blood 82:1507-1516 (1993)
C -1- FUNCTION: Erythropoietin is the principal hormone involved in the
regulation of erythrocyte differentiation and the maintenance of a
physiological level of circulating erythrocyte mass.
C -1- SUBCELLULAR LOCATION: Secreted.
C -1- SUBCELLULAR LOCATION: Secreted by kidney or liver of adult mammals
C -1- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals
C -1- SIMILARITY: Belongs to the EPO / TPO family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.

Disclosure; Page 39-40; 40pp; English.

The present sequence represents a modified human erythropoietin (EPO) protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The

```
specification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its analogues (where hEPO) is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycopylation sites covalently linked to a polycosylation site) and proposed is a rearrangement of a glycosylation site. The glycoprotein is covalently linked to a polycopylation site of production of reticulocytes and red blood cells. The EPO glycoprotein correased circulation of reticulocytes and red blood cells. The conjugate increased circulating half-life and plasma readidence time, decreased clearance, compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired circulating the division and differentiation of committed erythroid stimulating the division and differentiation of committed erythroid programments in the bone marrow
                                                                                                                                                                                                                                                                                                                                                     ö

The present sequence represents a modified human erythropoietin (BPD)

Cr protein. The EPD was extended at the N-terminal by a proteolytic cleavage

Site. It was used to produce conjugates of the invention. The

Specification describes a conjugate comprising an EPD glycoprotein having

an N-terminal alpha-amino group, chosen from human EPO (hEPD) or its

an N-terminal alpha-amino group, chosen from human EPO glycoprotein having

cr a rearrangement of a glycosylation site). The glycoprotein is

cr a rearrangement of a glycosylation site). The glycoprotein is

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently linked to a poly(ethylene glycol) group. The EPO glycoprotein

crowlently alpha-amin planema residence time, decreased clearance,

increased clinical activity in vivo, improved potency and stability, when

crompared to unmodified EPO. The EPO conjugate is useful for preparing

crompared to unmodified EPO. The EPO conjugate is useful for preparing

compared to unmodified EPO. The EPO conjugate is useful for preparing

commandeficiency syndrome (AIDS) and for treating cancer patients

cundergoing chemotherapy. It is also useful for treating patients by

stimmlating the division and differentiation of committed erythroid

crowpared to the pone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0

protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The SPO site. It was used to produce conjugate comprising an EPO site. It was used to produce conjugate comprising an EPO site. It was used to shall be amino group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein contains that and plasma residence time, decreased clarance, increased clinical activity in vivo, improved potency and stability, when compared to unmodified EPO. The EPO conjugate is useful for preparing compared to unmodified EPO. The EPO conjugate is useful for preparing anaemia in chronic renal failure parients (REP), acquired immunodeficiency syndrome (AIDS) and for treating cancer patients with consorting chemotherapy. It is also useful for treating patients by consorting patients in the hours manned.

"The EPO security of the comparing committed erythroid conversion in the hours manned."
                                                                                                                                                                                                                                                                                                                                                                                 Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence represents a modified human erythropoietin (EPO)

Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal fallure patients and acquired immunodeficiency syndrome.

Disclosure, Fig 3; 40pp; English.

profess. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hepO) or its an alogues (where hEPO is modified by addition of 1-6 glycosylation sites) or a rearrangement of a glycosylation site). The glycosylation sites or a rearrangement of a glycosylation site). The glycosylation sites or a rearrangement of a glycosylation site). The glycosylation sites or a rearrangement of a glycosylation site). The glycosylation sites or a rearrangement of a glycosylation site). The EPO glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein conforted or teticulorytes and red blood cells. The conjugate increased circulating half-life and plasma residence time, decreased clearance.

Compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired anaemia in chronic renal failure patients (CRF), acquired cundergoing chemotherapy. It is also useful for treating patients by stimulating the division and differentiation of committed erythroid progenitors in the bone marrow The present sequence represents a modified human erythropoietin (EPO)

The invention comprises the amino acid and coding sequences of non-glycosylated erythropoietin (EPO) analogues, where the lysine at position 45 and/or 116 has been replaced with an amino acid that cannot be perylated. The non-glycosylated EPO analogues of the invention are useful for treating anaemia. The present amino acid sequence represents a non-glycosylated EPO analogue with a modified protease B signal peptide. NOTE: The present sequence is included in the sequence listing as SEQ ID No 29, however another sequence on page 28 of the specification is also shown as SEQ ID No 29.
                                                                                                                                                                                                                                                               Non-glycosylated EPO analogue with modified protease B signal peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A non-glycosylated erythropoietin (RPO) analog useful treating anemia where the lysine at position 45 and/or 116 has been replaced with an amino acid that cannot be pegylated.
                                                                                                                                                                                                                                                                                                                               non-glycosylated erythropoietin analogue; EPO analogue; PEG; anaemia;

The present sequence represents a modified human erythropoietin (EPO)

protein. The EPO was extended at the N-terminal by a proteolytic cleavage
site. It was used to produce conjugates of the invention. The
specification describes a conjugate comprising an EPO glycoprotein having
an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its
analogues (where hEPO is modified by addition of 1-6 glycosylation sites
or a rearrangement of a glycosylation site). The glycoprotein is
covalently linked to a poly(cthylen glycol) group. The EPO glycoprotein
covalently linked to a poly(cthylen glycol) group. The EPO glycoprotein is
covalently linked to a poly(cthylen glycol) group. The EPO glycoprotein of
covalently linked activity of causing bone marrow cells to increase
circulating half-life and plasma readidence time, decreased clearance,
increased clinical activity in vivo, improved potency and stability, when
compared to unmodified EPO. The EPO conjugate is useful for preparing
compared to unmodified EPO. The EPO conjugate is useful for preparing
compared to the treatment and prophylaxis of diseases correlated with
compared to manodificate patients (CRF), acquired
anaemia in chronic renal failure patients (CRF), acquired
immunodeficiency syndrome (AIDS) and for treating patients by
cundergoing chemotherapy. It is also useful for treating patients by
stimulating the division and differentiation of committed erythroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.
                                                                                                                                       Human; erythropoietin; EPO; glycoprotein; reticulocyte production; red blood cell production; anaemia; chronic renal failure; acquired immunodeficiency syndrome; AIDS; cancer; bone marrow; committed erythroid progenitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tischer W;
                                                                                              Amino acid sequence of a modified human erythropoietin (EPO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schurig HE,

Length 169;

compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRP), acquired in immunodeficiency syndrome (AIDS) and for treating cancer patients undergoing chemotherapy. It is also useful for treating patients by stimulating the division and differentiation of committed erythroid progenitors in the bone marrow

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein. The invention relates to the production of dimeric, trimeric or polymeric fusion proteins with increased biological activity. The fusion proteins are used to treat or prevent protein-related deficiency states, specifically, where the protein is erythropoietin (EPO; AAX25689), anaemia, but also for increasing proliferation, differentiation and activity of haematopoietic progenitors (e.g. increasing numbers of

The present sequence represents a modified human erythropoietin (BPO) protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The specification describes a conjugate comprising an BPO glycoprotein having an N-terminal alpha-amin of group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a polly(ethylene glycol) group. The EPO glycoprotein bas in vivo biological activity of causing bone marrow cells to increase production of reticulocytes and red blood cells. The conjugate increased circulating half-life and plasma residence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when

Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.

This is used to increase the sialic acid content which in turn increases the solubility, half-life, biological activity and proteolysis resistance of the protein. The analogues are useful in claimed compsns. for the treatment of chronic renal failure associated anaemia. (Updated on 25-MAR-2003 to correct PN

```
This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may callow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating calbumin fusion protein is useful for preparing a composition for treating convel full-length human albumin therapeutic fusion protein of the convention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpot_sequences

Megakaryocyte-platelet growth factor - contains as active component human erythropoietin and is used to treat diseases caused by decrease in platelets.

Disclosure, Page 181; 8pp; Japanese.

All of the Cys residues in the SQ are labelled "SH". Megakaryocyte-platelet growth factor contains human BPO as an active principle. Human

```
EPO has a megakaryocyte colony-stimulating activity and increases the ratio of small acetyl cholinesterase positive cell (SAchB+) which is immature megakaryocyte. Human EPO effects megakaryocyte-platelet system other than an erythxocyte growth effect. Megakaryocyte-platelet growth is usable as a remedy for diseases caused by a platelet decrease

Recombinant haematopoietic molecules useful in treating anaemia(s) -comprise IL3 or GM-CSF and EPO, G-CSF, IL-5 or M-CSF and has early and later myeloid differentiation activity

Disclosure; Page 32; 82pp; English.

This protein sequence given comprises the entire amino acid sequence of human erythropoletin (BPO). EPO leads to the maturation of erythrocytes and is therefore designated as a late myeloid differentiation factor (MDF). Within the scope of the invention hybrid molecules were produced which contain at least a portion of an early MDF and at least a portion of an early MDF and at least a portion of an early MDF and at least a portion of an early MDF and at least a portion of an early MDF equally linked. The EPO sequence given is effective within the scope of the invention in full or in a truncated version.

Anino acids 7-161 act as a late MDF when recombined with an early MDF eq. IL-3. These compounds can be used to promote heamatopolesis in a patient. The Epoding of the early and late factors allows a very high conc. of late MDF with early MDA to act more specifically to stimulate only the allows the early MDA to act more specifically to stimulate only the desired lineage, thus reducing undesirable effects. These compounds are useful for treating anaemias of various origins eg.renal failure and

Human erythropoietin receptor agonist polypeptide - used to stimulate production of red blood cells in a patient.

Claim 1; Page 93; 112pp; English.

comprises a modified BPO amino acid sequence given in AAM58404, where (a) comprises a modified BPO amino acid sequence given in AAM58404, where (a) optionally 1-6 amino acids from the N-terminus and 1-5 from the C-terminus corp be deleted, (b) the N-terminus is joined to the C-terminus corporation and any two consecutive amino acids (c) there are new C- and N-terminia at any two consecutive amino acids from amino acids 23-24 to 38-39, 40-41 to 41-42, 43-44 to 48-49, 50-51 to 57-8; 77-78 to 82-83, 84-85 to 88-89, and 108-20 to 131-132, and (d) optionally the agonist polypeptide is preceded by Met, Ala, or Met-Ala. 60 Of these circularly permuted BPO receptor agonists (see AAW38413-72) are claimed. Also claimed are: nucleic acid molecules (see AAW30971-V31030) encoding novel BPO receptor agonists; a method of producing an BPO receptor agonist using transfected host cells, and methods for stimulating the production of transfected host cells, and methods for stimulating the production of haematopoietic cells, are selective ex vivo expansion of erythroid

10 Multi-functional chimeric haematopoietic receptor agonist - useful treat haematopoietic disorders, tumours, infections or autoimmune

Claim 1; Page 762; 841pp; English.

A human erythropoietin (EPO) receptor agonist polypeptide comprises a modified EPO amino acid sequence of the formula provided in AAW77780, in which the N-terminus is joined to the C-terminus directly or via a linker, the polypeptide having new C- and N-termini at one of the positions indicated. Novel claimed multi-functional chimeric hamanachopietic receptor agonists (see AAW77812-22) have the formula R1-L1-R2, R2-L1-R1, R1-R2 or R2-R1, where L is a linker and R1 and R2 are independently selected from: (a) the human EPO receptor agonist; (b) a human stem cell factor receptor agonist polypeptide (see AAW77781); (c) a

            human granulocyte colony stimulating factor (G-CSF) polypeptide (see AAW77783); (e) modified human interleukin-3 polypeptide (see AAW77784); (f) modified human interleukin-3 polypeptide (see AAW77784); (f) modified human c-mpl ligand polypeptide (see AAW77785); and (g) a factor selected from the group consisting of a CSF, a cytokine, a lymphokine, an interleukin and a haematopoietic growth factor, provided that at least R1 or R2 is selected from (a), (b) or (c) as above. The multi-functional chimeric haematopoietic receptor agonist can be used to stimulate the production of haematopoietic cells in a patient, for the ex vivo expansion of haematopoietic cells in a patient, for the expansion of haematopoietic cells in a patient.
                                                                                                                                                                                                                                                                                                                     69 VEVWOGIALLSEAVIRGOALLVNSSOPWEPLOLHVDKAVSGIRSLTTLLRALGAQKEAIS 128

Patent No. 5322837
GENERAL INFORMATION:
APPLICANT: Hewick, Rodney M.
TITLE OF INVENTION: METHOD FOR THE PURIFICATION OF
TITLE OF INVENTION: ERYTHROPOIETIN AND ERYTHROPOIETIN COMPOSITION
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Paul H. Heller
STREET: Kenyon & Kenyon, One Broadway

"Efficiency of signaling through cytokine receptors depends critically on receptor orientation.";

"Efficiency of signaling through cytokine receptors depends critically on receptor orientation.";

"INCTION: Erythropoietin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.

"INCRELUIAR LOCATION: Secreted.

"INCRELUIAR LOCATION: Secreted.

"INCREME SPECIFICIAL: Broduced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.

"INCREME SPECIFICIAL: Used for the treatment of anemia. Available under the names Epogen (Amgen). Epogin (Chugai). Epomax (Elanex), Eprex (Janssen-Cilag), NeoRecormon or Recormon (Roche), and Procrit (Ortho Biotech). Variations in the glycosylation pattern of Epochic are generically known as epoetin alfa, NeoRecormon and Recormon as epoetin beta and Epomax as epoetin omega.

"INCREMENTALITY: Belongs to the EPO / TPO family.

Monkey erythropoietin gene: cloning, expression and comparison with the human erythropoietin gene.";

Gene 44:201-209(1986).

-!- FUNCTION: Brythropoietin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of physiological level of circulating erythrocyte mass.

Physiological level of circulating erythrocyte mass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                82 EVGQQAVEVWQGLALLSEAVLRGQAVLANSSQPFEPLQLHMDKAISGLRSITTLLRALGA

Blood 82:1507-1516(1993).
-!- FUNCTION: Erythropoietin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.
-!- SIMILARITY: Belongs to the EPO / TPO family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (By similarity).

"Erythropoictin structure-function relationships: high degree of sequence homology among mammals.";

Blood 82:1507-1516(1993).

"FUNCTION: Erythropoictin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.

"FUNCELLULAR LOCATION: Secreted.

"SUBCELLULAR LOCATION: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals."

"In SISUE SPECIFICITY: Produced by Kidney or liver of adult mammals."

"In SIMILARITY: Belongs to the EPO / TPO family.

-!- FUNCTION: Erythropoietin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.
-!- SIMILARITY: Belongs to the EPO / TPO family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Potential.

protein beta2 subunit gene and the Epo gene.";
Oncogene 15:1995-1999(1997).
-1- FUNCTION: Erythropoietin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.
-1- SUBCELLUIAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.
-1- SIMILARITY: Belongs to the EPO / TPO family.

Blood 82:1507-1516(1993).
-!- FUNCTION: Brythroopictin is the principal hormone involved in the regulation of erythrocyte differentiation and the maintenance of a physiological level of circulating erythrocyte mass.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.
-!- SIMILARITY: Belongs to the EPO / TPO family.
